

CYVL Master Context Document

Version 2.1 — Canonical System Definition

1. Foundational Premise

Modern co-parenting environments frequently experience instability because the system relies on emotional communication, memory-based disputes, fragmented documentation, inconsistent schedules, and subjective interpretation of events. These conditions create environments where conflict escalates and clarity deteriorates. CYVL addresses this by introducing structured stability infrastructure.

2. Core Philosophy

- 1 Neutrality – The system records structured information without taking sides.
- 2 Structure Over Emotion – Information is recorded through structured inputs rather than narratives.
- 3 Clarity Over Volume – The goal is organized useful data rather than excessive documentation.
- 4 Pattern Recognition – Long-term patterns reveal more than isolated incidents.
- 5 Stability Engineering – Stability is created through structured systems.

3. What CYVL Is

CYVL is a co-parenting stability infrastructure platform designed to organize communication, schedules, and parenting events into structured records that reveal patterns over time.

4. What CYVL Is Not

- 1 A messaging app designed for conversation
- 2 A journaling platform
- 3 A legal judgment tool
- 4 A conflict escalation platform

5. CYVL System Architecture

Layer 1 — Structured Communication

Communication occurs in a structured environment designed to reduce reactive exchanges through guidance prompts and structured messaging categories.

Layer 2 — Guided Event Logging

Events are logged through predefined categories such as schedule changes, missed parenting time, school issues, and medical events. Entries are timestamped and categorized.

Layer 3 — Schedule Stability Tracking

The system tracks planned schedules, deviations, and changes over time to generate a schedule stability profile.

Layer 4 — Pattern Visualization

Structured data is translated into visual insights such as graphs, charts, and timelines to reveal patterns.

Layer 5 — Contextual Resource Pop-Ups

Context-aware resource prompts appear when specific events occur. They provide neutral educational resources to help users navigate situations without influencing outcomes.

Layer 6 — Courtroom Artifact Reporting System

CYVL reports are structured visual documentation artifacts designed to organize timelines, patterns, and structured records in a professional format suitable for courtroom presentation.

6. Report Design Philosophy

Reports prioritize visual pattern summaries, timeline structures, and structured event records. Graphs, charts, and visual patterns are preferred over raw numerical tables.

7. Data Neutrality

All CYVL data must remain neutral, structured, timestamped, and traceable to original entries.

8. Independent and Cooperative Use

- 1 Independent Use – One parent records events independently.
- 2 Parallel Use – Both parents use the system separately.
- 3 Cooperative Use – Both parents use the system collaboratively.

9. Long-Term Vision

CYVL aims to become stability infrastructure for co-parenting systems by organizing complex family dynamics into structured clarity.
